

Key Systems Key Boxes

The Security Key Dispenser (Electronic Key Cabinet) makes the automated dispensing of keys convenient and secure. Your keys are safely stored in locked cabinets only opened by valid access codes.

Cabinets are compatible with local or remote keypad, card swipe, and biometric or custom reader technology. The Security Key Dispenser (SKD) has taken into account all of your needs. You decide - through simple programming - who uses what keys, when, and for how long.

Program users with access levels, time zones, alerts, and alarms. If your SKD is tampered with, a wrong PIN is entered, or a key is not returned on time, the SKD will let you know. For quick dispensing and auditing, keys are returned to their original position.

The SKD's expansive memory stores all activities and programs. Even if the power goes out, Lithium chips protect the memory for 5 years, and a 12-hour back-up battery assures continued key access.

The SKD's are powered for worldwide use.

Expansive Networking handles numerous SKD's and distances with ease. Connect your SKD's through TCP/IP addressing networks, RS232's, RS485's, modems with telephones, and radio. Your options are vast. Together we can come up with a system that best fits your environment and creates total security with complete ease.
